INCIDENT INVESTIGATION & RESOLUTION REPORT

INC-BAA539E5 · New users land on the login page after signing up · Mission MSN-3C8A43AC

Outcome: SOLUTION READY: approved by humans and handed to the owning team (not applied by this system)

Service	Environment	Severity	Iterations	Agents used	Tool calls	Requested by
employee-portal	Production	High	1 of 3	6	21	Alex Morgan

The Orchestrator ran 1 iteration with a team chosen for this ticket. 6 agent findings were produced using 21 read-only tool calls (reading evidence, logs, status, changes, source files and runbooks).

Where the findings came from: 6 × Foundry agent.

Final assessment: Final validation [Correctness PASS · Completeness FAIL · Consistency PASS · Security PASS · Approvals PASS]. The root cause is well identified and supported by code and log evidence: the register function redirects to login and uses a form that does not save extra fields. The proposed fix is concrete and human-approved, including updating to a custom form and redirect to employee_list with immediate login. However, no fix execution or validation evidence is yet available here, and this system cannot deploy or run tests. Therefore, the incident is not resolved but solution ready for implementation approval and deployment by the owning team. The root cause is clearly identified with high confidence and aligns with observed logs and repository analysis. The fix matches the root cause and has human approvals for cause and fix. Security and rollback are acceptable. Completeness is not yet met as there is no validation from executed tests or measured recovery due to system boundaries. Human approval gates are satisfied so far.

1. The issue (the input we were given)

Description: Since the last release, people who register on the Employee portal are sent to the login page instead of the employee list, and the extra fields of our custom registration form are no longer saved. Existing users can log in normally.

Business impact: Every new HR user must log in a second time and their profile details are missing; support tickets are rising.

Observed error: No error is shown. Expected redirect to 'employee_list' after register; actual redirect to 'login'.

Expected behaviour: After registering, the user is signed in and sees the employee list.

ID	Type	Evidence	Classification
`EVD-3D9D3F33`	Log	Web server access log during a sign-up	Observed

2. What the agents did, iteration by iteration

Iteration 1

Orchestrator's reasoning (Foundry agent): The incident concerns a redirection issue and data loss for new user registrations after the last release in production. Logs show registration POST redirected to login, causing missing profile fields and extra login step. No explicit errors or security alerts appear, so initial focus is on log analysis, repo commits around release, and root-cause synthesis to isolate the regression.

Agent	Why it was chosen	Source	Confidence
Intake & classification	To verify incident severity and scope details to align the investigation focus early.	Foundry agent	0.90
Log analysis	Web server logs capture request/response sequences with HTTP codes relevant to registration and redirects.	Foundry agent	0.95
Repository analysis	The issue appeared immediately post release; analyzing recent commits and deployment notes can pinpoint potential code changes causing the fault.	Foundry agent	0.90
Root-cause analysis	Synthesizing evidence from logs and repo changes is necessary to isolate the root cause before proposing remediation.	Foundry agent	0.95
Remediation	Added automatically: every team needs a diagnosis, a proposed fix and a check so one iteration can end with a reviewed solution.	Foundry agent	0.95

Agent	Why it was chosen	Source	Confidence
Validation	Added automatically: every team needs a diagnosis, a proposed fix and a check so one iteration can end with a reviewed solution.	Foundry agent	0.95

Left out on purpose: observability (No performance degradation, latency spikes, or system errors are indicated in symptoms or logs.); knowledge (As this is a new regression post-release without prior similar incidents reported, runbooks or past post-mortems may offer limited initial value.); testing (Testing strategy depends on proposed remediation and must follow root cause analysis.); security (No security anomalies or data leak indicators are present; does not appear security related.); risk (Risk assessment depends on the known mitigation plan, appropriate only after root cause and remediation definition.); release (Release coordination follows fix approval and validation, beyond investigation and diagnosis scope now.); summary (Incident summary drafting awaits confirmed root cause and resolution; premature at this stage.)

3. Investigation trail: what each agent looked at and concluded

Intake & classification · iteration 1 · AI-GENERATED / Foundry agent behave-intake v7

Tool	Input	Result
`get_ticket`	-	ticket read
`list_evidence`	-	1 evidence
`read_evidence`	EVD-3D9D3F33	Web server access log during a sign-up

Finding: Since the last release, new users registering on the employee-portal in the production environment are redirected to the login page instead of the employee list, and their custom registration form fields are not saved. This forces new HR users to log in again, causing user experience degradation and an increase in support tickets. Existing users can log in without issue. The problem was detected from at least 2026-11-14, supported by web server logs showing the redirect to '/login/' after registration. Missing are backend error logs or application-level diagnostics that explain why the successful registration POST triggers a wrong redirect and why registration data is not persisted. *(confidence 0.90; evidence cited: EVD-3D9D3F33)*

Log analysis · iteration 1 · AI-GENERATED / Foundry agent behave-logs v7

Tool	Input	Result
`list_log_files`	-	0 logs
`search_logs`	/register/	2 matching lines (2026-11-14T09:12:01 to 2026-11-14T09:12:19)
`search_logs`	ERROR, ERROR	0 matching lines

Finding: The registration and login related logs show that after a POST /register/ request, there is a 302 redirect to /login/, which confirms that new users are sent to the login page after signing up instead of the employee list page. There are no ERROR level logs related to registration or login in the available evidence, indicating no explicit server errors during these requests. This redirect behavior is evident in the log lines from EVD-3D9D3F33, with the first POST /register/ at 09:12:19 and subsequent redirect to /login/. *(confidence 0.95; evidence cited: EVD-3D9D3F33)*

Repository analysis · iteration 1 · AI-GENERATED / Foundry agent behave-repository v7

Tool	Input	Result
`list_changes`	-	6 changes
`search_repo`	register	15 matches
`search_repo`	redirect	10 matches
`search_repo`	employee_list	12 matches
`read_repo_file`	employee_management/employees/views.py, 60, 20	employee_management/employees/views.py read

Finding: The function 'register' in 'employee_management/employees/views.py' is responsible for the user registration logic and redirects users to the 'login' page instead of 'employee_list' after registration. This behavior is due to the code in the latest version of the 'register' function where after form validation and saving, it redirects to 'login' rather than 'employee_list'. No recent commit explicitly changing this redirect was identified in the last changes, but the current code in the repository shows the faulty redirect logic causing the issue. *(confidence 0.90; evidence cited: EVD-3D9D3F33)*

Root-cause analysis · iteration 1 · AI-GENERATED / Foundry agent behave-root-cause v8

Tool	Input	Result
`list_evidence`	-	1 evidence
`search_logs`	register	2 matching lines (2026-11-14T09:12:01 to 2026-11-14T09:12:19)
`search_logs`	redirect	0 matching lines
`search_repo`	register	15 matches
`read_repo_file`	employee_management/employees/views.py, 5, 30	employee_management/employees/views.py read

Finding: The root cause of the issue is the register function in 'employee_management/employees/views.py'. The code shows that after form validation and user creation, the function redirects to 'login' page instead of 'employee_list'. This explains the symptom where new users are sent to the login page after registering as observed in the access log (EVD-3D9D3F33). Additionally, the form being used is UserCreationForm, which likely does not handle saving the extra custom fields, causing those fields not to be saved as reported. This explains both the incorrect redirect and the missing profile details as a direct consequence of this register function's implementation, matching exactly the described symptoms. *(confidence 0.95; evidence cited: EVD-3D9D3F33)*

Remediation · iteration 1 · AI-GENERATED / Foundry agent behave-remediation v8

Tool	Input	Result
`read_repo_file`	employee_management/employees/views.py	employee_management/employees/views.py read
`list_changes`	-	6 changes
`read_repo_file`	employee_management/employees/forms.py	employee_management/employees/forms.py read

Finding: The root cause of the issue is the user registration function in 'employee_management/employees/views.py' where the current code directs new users to the 'login' page after registration and uses UserCreationForm which only saves basic user fields. This causes new users to be redirected to login instead of the 'employee_list', and the extra custom registration form fields are not saved. The fix is to update the 'register' function to use the custom RegisterForm that includes additional fields, log the user in immediately upon registration, and redirect to 'employee_list'. This will restore the expected behavior and saving of extra fields. *(confidence 0.95; evidence cited: EVD-3D9D3F33)*

Validation · iteration 1 · AI-GENERATED / Foundry agent behave-validation v7

Tool	Input	Result
`list_evidence`	-	1 evidence
`get_service_status`	-	status read

Finding: Acceptance criteria for calling this fixed should include: 1) New users registering should be automatically redirected to the 'employee_list' page after registration instead of the login page. 2) All custom fields in the registration form should be saved correctly in the user profile. 3) No regression in login or registration functionality as indicated by absence of error logs or failures. Current evidence confirms the root cause and symptom (redirect to login) but there is no evidence of verification of fixes or test results that prove these criteria are met yet. Therefore, no acceptance criteria are fully met yet and nothing can be validated as fixed so far. *(confidence 0.95; evidence cited: EVD-3D9D3F33)*

4. Issues found and what was solved

Item	What we found	Status
Root cause	The root cause of the issue is the register function in 'employee_management/employees/views.py'. The code shows that after form validation and user creation, the function redirects to 'login' page instead of 'employee_list'. This explains the symptom where new users are sent to the login page after registering as observed in the access log (EVD-3D9D3F33). Additionally, the form being used is UserCreationForm, which likely does not handle saving the extra custom fields, causing those fields not to be saved as reported. This explains both the incorrect redirect and the missing profile details as a direct consequence of this register function's implementation, matching exactly the described symptoms.	Confirmed by a human

Item	What we found	Status
Proposed fix	The root cause of the issue is the user registration function in 'employee_management/employees/views.py' where the current code directs new users to the 'login' page after registration and uses UserCreationForm which only saves basic user fields. This causes new users to be redirected to login instead of the 'employee_list', and the extra custom registration form fields are not saved. The fix is to update the 'register' function to use the custom RegisterForm that includes additional fields, log the user in immediately upon registration, and redirect to 'employee_list'. This will restore the expected behavior and saving of extra fields.	Approved; handed to the owning team
Acceptance criteria	Acceptance criteria for calling this fixed should include: 1) New users registering should be automatically redirected to the 'employee_list' page after registration instead of the login page. 2) All custom fields in the registration form should be saved correctly in the user profile. 3) No regression in login or registration functionality as indicated by absence of error logs or failures. Current evidence confirms the root cause and symptom (redirect to login) but there is no evidence of verification of fixes or test results that prove these criteria are met yet. Therefore, no acceptance criteria are fully met yet and nothing can be validated as fixed so far.	To verify after the fix is implemented
Gap after iteration 1	Validation failed on: completeness. Not yet covered: testing.	Still open
Pull request	#1 on harshavardhansu/behave-demo-employee-app (branch behave/inc-baa539e5-msn-3c8a43ac): https://github.com/harshavardhansu/behave-demo-employee-app/pull/1	Opened; awaiting the project's pipeline, review and merge

The exact code change (checked against the current files):

`employee_management/employees/views.py` · +7 / -5

```
@@ -56,16 +56,18 @@
         return redirect('employee_list')
     return render(request, 'employees/employee_confirm_delete.html', {'employee': employee})

5. Human decisions (every key step needed a person)

When	Gate	Decision	By	Note	Time (UTC)
Iteration 1	team	approve	Alex Morgan	-	2026-11-14 19:55:01
Iteration 1	root-cause	approve	Alex Morgan	-	2026-11-14 19:55:23
Iteration 1	fix	approve	Sam Rivera	-	2026-11-14 19:55:35
Iteration 1	resolution	handoff	Alex Morgan	Reviewed by the cloud smoke test	2026-11-14 19:55:46

6. Final validation

Check	Result
Technical correctness	PASS
Completeness	FAIL
Cross-agent consistency	PASS
Security and risk acceptable	PASS
Human approvals satisfied	PASS

The root cause is clearly identified with high confidence and aligns with observed logs and repository analysis. The fix matches the root cause and has human approvals for cause and fix. Security and rollback are acceptable. Completeness is not yet met as there is no validation from executed tests or measured recovery due to system boundaries. Human approval gates are satisfied so far.

7. Learnings carried between iterations and open items

• No learnings recorded yet.

Next step: the owning team reviews pull request #1 (https://github.com/harshavardhansu/behave-demo-employee-app/pull/1), lets the project's pipeline test it, and merges it. This system opened the pull request on a new branch only; it did not merge, deploy or test anything.

Still to do: testing

All findings are AI-generated proposals for human review. Agents can read but never change anything; every change in this mission was approved by a person.
